IMPLEMENTATION OF DECOMPENSATED CIRRHOSIS DISCHARGE BUNDLE: A UNIVERSITY HOSPITAL EXPERIENCE

Muhammad Zuhaid, Muhammad Omar Saeed, Krish Bountra, Esther Unitt, Sophia Than

Gastroenterology Unit, University Hospital Coventry & Warwickshire

INTRODUCTION
Decompensated Liver Cirrhosis is a frequent reason for admission to the hospitals, and the complex medical needs in such patients could lead to prolonged hospital stay and increased mortality risk1.

A significant rise in the prevalence of liver cirrhosis in the UK has been noted, with the major culprits being alcoholic related liver diseases, hepatitis B & C, and non alcoholic obesity related disease2.

Re-admission to the hospitals are common following discharge of the patients with decompensated cirrhosis. To improve the quality of discharge and reduce the re-admissions, a discharge bundle has been developed by the British Society of Gastroenterology (BSG) and British association for the study of liver diseases (BASL).

A study revealed that decompensated liver cirrhosis discharge bundle improves outcomes in the patient care3.

CURRENT SITUATION
It hasn’t been adopted by most of the trusts as it was introduced recently

No data available whether it has been implemented or tried to be adopted in various trusts across the UK

The bundle has been kept simple so that it can be filled easily by the health care professionals

AIMS
Assessment of the practice within our hospital against BSG/BASL standards

Evaluation of the impact by the implementation of discharge bundle based upon the BSG/BASL toolkit.

METHODS
National QIP Model Strategy of PDSA cycle 1 and 2 adopted

Retrospective audit in PDSA cycle 1 was carried out on 40 patients admitted with decompensated cirrhosis.

Prospective 3 months audit after intervention

RESULTS (PDSA Cycle 1)
Baseline audit revealed inconsistencies in discharge documentations of the patients with decompensated liver cirrhosis.

Documentation in most of the discharge letters was suboptimal when assessed against the discharge bundle tool kit.

INTERVENTIONS
Emails circulated to juniors to inform them regarding the importance and the way to fill the proformas

Awareness Posters were displayed in gastroenterology unit

RE-AUDIT (PDSA Cycle 2)
The overall results improved significantly as compared to the PDSA cycle 1

The detailed results are illustrated in the form of graphs & charts

CONCLUSION
There has been a significant improvement in discharge letter documentations after implementation of decompensated cirrhosis discharge bundle.

RECOMMENDATIONS
We need to incorporate the cirrhosis discharge bundle into the CRRES library for easier access to the juniors while completing the discharge letters.

Additionally, junior doctors to be educated about the discharge bundle as a part of mandatory induction session.
